LPMS-CANAL Reference Manual

Version 1.2.7

© 2014 LP-RESEARCH

www.lp-research.com

I. INTRODUCTION

Welcome to the LP-RESEARCH Motion Sensor CAN bus version with aluminum housing (LPMS-CANAL) User's Manual!

In this manual we will try to explain everything you need to know to set up the LPMS-CANAL hardware, install and use its software, as well as getting started with integrating the sensor within your own software project. We have put a lot of effort into making the LPMS-CANAL a great product, but we are always eager to improve and work on new developments. So, if you have any further question or have any comment regarding this manual please feel free to contact us anytime.

For more information on the LPMS-CANAL or other product series, please refer to the flyers, datasheets or user manuals, available from the LP-RESEARCH Inc. website at the following address: <u>http://www.lp-research.com</u>.

IV. DEVICE OVERVIEW

Measurement Output

The LP-RESEARCH Motion Sensor CAN bus version with aluminum housing (LPMS-CANAL) is a wired inertial measurement unit. We designed the unit to be water proof so that it can be used in a wide range of industrial applications. The unit can measure orientation in 360 degrees about all three global axes. Measurements are taken digitally and transmitted to a data analysis system in the form of orientation quaternion or Euler angles. Whereas Euler angles are the traditional way of describing the orientation of an object, quaternion allow orientation measurement without encountering the so-called Gimbal's lock by using a four-element vector to express orientation around all axes without being limited by singularities. A more in-depth explanation of the quaternion output of the LPMS-CANAL will follow later on in this manual.

In addition, a pressure sensor is selectable on the LPMS-CANAL for some specific applications, such as GPS navigation enhancement, indoor and outdoor navigation, vertical velocity indication, etc.

Technical Background

To measure the orientation of an object, the sensor internally uses three different sensing units. These units are micro-electro-mechanical system (MEMS) sensors that integrate complex mechanical and electronic capabilities on a miniaturized device. The units used in the LPMS-CANAL for orientation determination are a 3-axis gyroscope (detecting angular velocity), a 3-aixs accelerometer (detecting the directing of the earth's gravity field) and a 3-axis magnetometer to measure the direction of the earth magnetic field. In principle orientation data about all three room axes can be determined by integrating the angular velocity data from the gyroscope. However through the integration step the error from the gyroscope measurements, although it might be very small, has an exponential influence on the calculation result. Therefore we correct the orientation data from the gyroscope with information from the accelerometer (roll and pitch angles) and magnetometer (yaw angle) to calculate orientation information of high accuracy and stability while guaranteeing fast sampling rates. We combine the orientation information from the three sensing units using a complementary filter in conjunction with an extended Kalman filter (EKF). The Kalman filter allows us to reduce the measurement error especially in case of regular movements (e.g. human gait analysis, vehicle vibration analysis etc.). Sampling rates of the sensor can be adjusted to up to 300 Hz internal measurement frequency.

Communication Methods

Data can be transferred either using a CAN Bus network connection. For communication protocols we rely on commonly used open standard protocols: CANOpen implementation or our proprietary LpCAN protocol.

Calibration

For accurate operation the sensor needs to be calibrated. The calibration procedure includes the determination of the gyroscope data offset, gyroscope movement threshold, accelerometer misalignment, accelerometer offset, and magnetometer interference bias and gain. As the earth magnetic field can be distorted by metal or electromagnetic sources within the vicinity of the sensor, the re-calibration of the magnetic sensor and re-calculation of the magnetic reference vector of the sensor might be necessary when using the sensor in different location or under varying experiment environments. Later in this manual we will describe in detail the necessary calibration procedures and measures to be taken to guarantee the accuracy of the measurements taken by the sensor. We tried to automate the calibration procedures as far as possible inside the firmware of the sensor to make the usage as convenient as possible for the users.

Magnetic Field Distortion Compensation

Additionally to the established method of compensating a distorted earth magnetic field by re-adjusting the magnetometer bias and gain, the LPMS-CANAL offers either completely switching off the magnetometer compensation of the gyroscope data or selectively switching the compensation modes between: dynamic, weak, medium and strong magnetometer correction, in places where an earth magnetic field outside the normal limits is being detected. We implemented a special algorithm that allows switching between operation with different modes of magnetometer compensation and without magnetometer compensation without any inconsistencies in the orientation detection. For further adjustment of the calibration parameters to the sensor environment a temperature sensor and pressure sensor have been optionally integrated on the LPMS-CANAL. Data from these indicators can be utilized by the user to correct raw data measurements from the LPMS-CANAL sub-sensors.

Application Areas

The sensor can be effectively used in the field of virtual reality, navigation, robotics, or for measuring vehicle dynamics. If more than one sensor is used for a sensor network the motion of complex objects as necessary in cinematic motion capturing or animation movie production is possible.

V. DEVICE SPECIFICATIONS

Please see the below table of the summary of sensor specification. Please refer to the section "X. *MECHNICALINFORMATION*" for detail introduction of package layout.

Wired Interface	CAN Bus		
Maximum baudrate	1Mbit/s		
Communication protocol	LpCAN / CANOpen		
Size	48 x 40 x 23 mm		
Weight	67.5 g		
Orientation	360 [°] about all axes		
Resolution	< 0.05 °		
Accuracy	< 2 °RMS (dynamic), < 0.5 (static)		
Accelerometer	3-axis, ±20 / ±40 / ±80 / ±160 m/s ² , 16 bits		
Gyroscope	3-axis, ±250 / ±500 / ±2000 ^O /s, 16 bits		
Magnetometer	3-axis, ±130 ~ ±810 uT, 16 bits		
Pressure sensor	300 ~ 1100 hPa *		
Data output format	Raw data / Euler angle / Quaternion		
Sampling rate	0 ~ 300 Hz.		
Latency	5ms		
Power consumption	165 mW		
Supply voltage (Vcc)	4∼ 18 V DC		
Connector	SACC-DSI-MS-5CON-PG 9/0,5 SCO, M12		
Case material	Aluminum		
Temperature range	- 40 ~ +80 °C		
Software	C++ library for Windows, Java library for Android, LpmsControl		
	utility software for Windows, Open Motion Analysis Toolkit		
	(OpenMAT) for Windows		

*The pressure sensor is optional and can be added on LPMS-CANAL, which depends on the requirement from users. Please contact us for more information about this.

VI. CONNECTOR CONFIGURATION

Connector pin-out is as below.

Pin description:	Pin no.	1	2	3	4	5
	Function	CAN_SHLD	CAN_V+	CAN_GND	CAN_H	CAN_L
	CAN_SHLD: not connected					
	CAN_V+: External positive power supply			4	3 •	
	CAN_GND: Ground				2	
	CAN_H: CAN_H bus line(dominant high)		•			
	CAN_L: CAN_L bus line(dominant low)		le			
Connector type:	Phoenix Contact: SACC-DSI-MS-5CON-PG 9/0,5 SCO, M12					
Pared cable type:	Phoenix Contact: SAC-5P- 1,5-PUR/M12FS SH					

VII. OPERATION

Powering Up and Operation Modes

The LPMS-CANAL sensor is switched on by connecting the sensor with a power source via the power lines of the CAN bus connector. There are 3 different modes for operation:

Mode	Description		
Command mode	In command mode the functionality of the sensor is accessed		
	command-by-command. Also data is transferred from the sensor to		
	the user by a special command. This mode is suitable for making		
	adjustments to the parameter settings of the sensor and synchronized		
	data-transfer.		
Streaming mode (default)	In streaming mode data is continuously sent from the sensor to the		
	host. This mode is suitable for simple and high-speed data		
	acquisition. Sensor parameters cannot be set in this mode.		
	The data is sent out by CANOpen protocol.		
Sleep mode (reserved)	Sleep mode is the power-saving state of the sensor. The sensor can be		
	woken up by switching into streaming mode or command mode. In		
	this mode no data can be read from the sensor.		

Please see the table below for the available options depending on the user's actions:

User action	Description
Sensor power-on	The sensor is now in CANOpen streaming mode and continuously
	sends data over the CAN bus using the CANOpen protocol.
User sends data to sensor	Sensor is always waiting for "Goto command mode" instructions to
using LpCAN protocol	switch to command mode over the CAN port with LpCAN protocol.
	This is also the way the LpmsControl application communicates with
	the sensor.

Host Device Communication

Users should be able to communicate with LPMS-CANAL using any standard CAN interface. The CAN message uses standard 11 bits identifier and 8 bytes of data. The default connection baudrate is

OPERATION

1Mbit/s (For long distance communication, the 120 ohm resistors might be needed while using 1Mbit/s baudrate).

Data Acquisition

For data acquisition, all the communications with the device needs to be according to CANOpen or LpCAN protocol, which is introduced in section "*VIII. COMMUNICATION PROTOCOL*".

Raw Sensor Data

The LPMS-CANAL contains three MEMS sensors: A gyroscope, an accelerometer and a magnetometer. The raw data from all three of these sensors can be accessed by the host system based on the LpCAN/CANOpen protocol. This data can be used to check if the current acquisition range of the sensors is sufficient and if the different sensors generate correct output. Users can also implement their own sensor fusion algorithms using the raw sensor data values. Sensor range and data sampling speed can be set by sending commands to the firmware. Details will be explained later on in this manual at section of "VIII. COMMUNICATION PROTOCOL".

The LPMS-CANAL is calibrated by default, but it might be necessary to recalibrate the sensors if the measurement environment changes (e.g. different ambient electromagnetic field, strong temperature changes). Please refer to the following sections for a detailed introduction of sensor calibration methods.

Orientation Data

The LPMS-CANAL has two orientation output formats: quaternion and Euler angle. As the Euler angle representation of orientation is subject to the Gimbal lock, we strongly recommend users to use the quaternion representation for the orientation calculation where possible.

Filter Settings

Data from the three MEMS sensors is combined using an extended complementary Kalman filter (LP-Filter) to calculate the orientation data (orientation quaternion and Euler angles). To make the filter operate correctly, its measurement parameters need to be set in an appropriate way.

Filter Modes

First, the mode of the filter needs to be selected, which can be set by LpmsControl software or firmware commands. The following filter modes are available:

Filter mode	Description
Gyroscope only	Only the data from the gyroscope is used to calculate the orientation data
	output from the sensor. In this mode the orientation data can be calculated
	very quickly and with little noise. However, a strong drift of the acquired
	values can occur due to the inherent bias problem of gyroscope. This mode
	should therefore be only used for cases in which a frequent reset of the
	zero-angle position is allowed.
Gyroscope +	The orientation data that is calculated from the gyroscope is corrected by the
accelerometer	accelerometer data based on quaternion representation. The accelerometer
(default mode)	acquires accurate information about the roll and pitch orientation regarded
	with the earth gravity vector. The result of the correction is therefore
	orientation information that has very little error on the roll and pitch axis, the
	yaw axis however is still affected by the drift of the un-corrected gyroscope
	data.
	This mode might be significant useful when there is a strong magnetic
	interference that can hardly be efficiently calibrated exiting around the sensor
	and only the roll and pitch information is interest to the users.
Gyroscope +	Orientation data from the gyroscope that has been corrected by the
accelerometer +	accelerometer output as previously described is additionally modified by the
magnetometer	direction of the earth magnetic field. This results in accurate orientation
	information for all three axes. This mode delivers good speed and accuracy
	for roll, pitch and yaw. In this mode, (un-calibrated) distortions of the earth
	magnetic will affect the accuracy of the orientation measurement.
Accelerometer +	Orientation is directly calculated by the combination of the data from
magnetometer	accelerometer and magnetometer using Euler representation. Therefore it has
(Euler only)	the singularity problem at certain orientations. Based on the information of
	gravity in the vertical frame and the geomagnetic field vector in horizontal
	frame, the roll, pitch and yaw angle can be achieved based on the readings
	from accelerometer and magnetometer. This mode is suitable for the
	application of small motion and limited magnetic distortion.
Gyroscope +	The orientation data that is calculated from the gyroscope is corrected by the
accelerometer	accelerometer data based on Euler representation. Therefore it has the
(Euler only)	singularity problem at certain orientations. The accelerometer acquires
	accurate information about the roll and pitch orientation regarded with the
	earth gravity vector. The result of the correction is therefore orientation
	information that has very little error on the roll and pitch axis, the yaw axis

	however is still affected by the drift of the un-corrected gyroscope data.
	This mode might be significant useful when there is a strong magnetic
	interference that can hardly be efficiently calibrated exiting around the sensor
	and only the roll and pitch information is interest to the users.

Magnetometer Correction Setting

The amount by which the magnetometer corrects the orientation output of the sensor can be controlled by the magnetic correction settings. The following options are selectable through LpmsControl or directly through the firmware commands.

Parameter presets	Description
Dynamic (default)	The value "Dynamic" means the magnetic correction inside the filter is performed dynamically together with the acceleration data according to the variance of magnetic interference. This parameter set is suitable for the situation when the magnetic interference keeps changing.
Weak	The value "weak" means the magnetic correction inside the filter has little impact on the orientation output. Sensor orientation is calculated mainly from the acceleration / gyroscope data. This parameter set is suitable for situations when strong magnetic interference that cannot be compensated through calibration appear regularly.
Medium	With the "medium" correction setting the impact of the magnetometer readings is still relatively weak, but stronger than in "weak" mode. This mode should be suitable for environments with occasional irregular field distortions.
Strong	In this mode the magnetometer readings have a strong direct impact on the orientation output. It can be used in environments with a calibrate-able constant field distortion or in "clean" fields (outside buildings with no metal parts or strong power sources in the vicinity of the sensor). Yaw orientation measurement in world coordinates will be most accurate in this mode.

Acceleration Compensation Setting

The amount by which the accelerometer corrects the orientation output of the sensor can be controlled by both linear acceleration and centripetal acceleration settings. The following options are selectable through LpmsControl or directly through the firmware commands.

Parameter presets	Description		
Off	There is no linear acceleration compensation for the sensor fusion		
	in this mode. This parameter set is suitable for situations when		
	there is no linear acceleration appears.		
Weak	The value "weak" means the linear acceleration correction inside		
	the filter has little dynamic impact on the orientation output. This		
	parameter set is suitable for situations when linear acceleration		
	appears regularly and slightly.		
Strong (default)	The value "Strong" means the linear acceleration correction inside		
	the filter has strong dynamic impact on the orientation output. This		
	parameter set is suitable for situations when linear acceleration		
	appears regularly and strongly.		

Linear Acceleration Correction Settings

Rotational Acceleration Correction Settings

Parameter presets	Description				
Disable	There is no rotational acceleration compensation for the sense				
	fusion in this mode.				
Enable (default)	There is dynamic rotational acceleration compensation for the				
	sensor fusion in this mode.				

Gyroscope Threshold

The input from the gyroscope can be thresholded so that the sensor orientation data is only updated when the sensor is moved. This threshold is automatically determined during gyroscope calibration.

Parameter preset	Description	
Enable	Switches gyroscope threshold on.	
Disable (default)	Switches gyroscope threshold off.	

Gyroscope Auto-calibration Function

The selection of the following parameter values allows the users to enable or disable the gyroscope auto calibration function. In auto calibration mode the filter is automatically detects if the sensor is moving or not. If the sensor stays still for a certain time, the currently sampled gyroscope data will be used to re-calculate the gyroscope offset. This function is significant useful when the user is using the "Gyroscope only" filter mode, and most the time of the system stays still. Using this function will reduce the drift problem of the gyroscope.

Parameter preset	Description
Enable (default)	Switch gyroscope auto-calibration on.
Disable	Switch gyroscope auto-calibration off.

Low Pass Filter Setting

The selection of the following parameter values allows the users to further implement a simple low pass filter for smoothing the output data after the sensor fusion algorithm. The low pass filter is based on the following formula: $X_i = (1-a)^* X_{i-1} + a^* U_i$, where *a* is the coefficient listed in the following table, *U* is the input.

Parameter preset	Description
Off (default)	No filter implemented.
0.1	<i>a</i> = 0.1
0.05	a = 0.05
0.01	<i>a</i> = 0.01
0.005	a = 0.005
0.001	a = 0.001

Trade-offs and Limitations

Although we have put (and still do) a lot of effort into the design of the LPMS-CANAL, there are a few limitations of the sensor that need to be taken into account when using the device. The accuracy of the sensor is limited by the electronic noise level of the MEMS sensors used in the LPMS-CANAL. Although the sensor data acquisition speeds for gyroscope, accelerometer and magnetometer are more than 500Hz, but the data output frequency of the whole system is limited to a certain frequency (up to 300Hz). The parameters of the filter that fuses the data from the gyroscope, magnetometer and accelerometer need to be adjusted well, in order to achieve measurements with maximum accuracy. Furthermore, in case the sensor is used in changing environments, the sensor

occasionally might need to be re-calibrated. The greatest drawback of the measurement principle of the sensor certainly is its affectability by a deformed earth magnetic field (in the vicinity of hard / soft iron, electric motors etc.). In such situations the use of the filter mode and parameters of the filter must be well considered.

Calibration Methods

Basic Gyroscope Calibration

When the sensor is resting the output data of the gyroscope should be around zero. The raw data from the gyroscope sensor has a constant bias of a certain value. To determine this value please follow the following calibration procedure:

Step	Description
1	If it is not already switched on, power up the LPMS-CANAL device.
2	Put the sensor in a resting (non-moving) position.
3	Connect to the sensor.
4	Trigger the gyroscope calibration procedure either through a firmware command or using
	the "Calibrate gyroscope" function in LpmsControl software.
5	The gyroscope calibration will take around 30s. After that the gyroscope is calibrated,
	normal operation can be resumed.

Additionally to the gyroscope bias, the gyroscope threshold value will be adjusted during this calibration procedure. By default the use of the gyroscope threshold is disabled. It can be enabled by sending a firmware command or using the LpmsControl software. The gyro auto calibration function is enabled by default.

Advanced Gyroscope Calibration

The gain and misalignment parameters of gyroscope can be further calibrated under the following instructions by expert users.

Step	Description
1	If it is not already switched on, power up the LPMS-CANAL device.
2	Put the sensor on a turntable which is placed horizontally.
3	Set the rotating rate of the turntable to 45rpm.
4	Trigger the gyroscope misalignment calibration procedure either through a firmware
	command or using the "Calibrate gyr. misalignment" function in LpmsControl software.
5	Following the guideline of pop out window, to set the x axis upwards, and start the

	turntable until the x axis calibration is finished			
6	To set the y axis upwards, and start the turntable until the y axis calibration is finished			
7	To set the z axis upwards, and start the turntable until the z axis calibration is finished			
	After finishing the above procedures the gyroscope misalignment matrix and gain values			
	will be re-calculated. This finishes the gyroscope advanced calibration.			

Magnetometer Calibration

During the magnetometer calibration procedure several parameters are to be determined: magnetometer bias and gain on the X, Y and Z-axis; length and direction of the geomagnetic field vector. In most environments the earth magnetic field is influenced by electromagnetic noise sources such as power lines, metal etc. As a result the magnetic field becomes de-centered and deformed. During the magnetometer calibration the amount of de-centering and deformed as well as the average length of the magnetic field vector is calculated. These parameters are tuned automatically using the calibration procedures in the LpmsControl software:

Step	Description			
1	If it is not already switched on, power up the LPMS-CANAL device.			
2	If it is not already connected, connect to the sensor.			
3	Start the magnetometer calibration using the LpmsControl software.			
4	Rotate the sensor around its yaw axis for 2~3 rotations.			
5	Rotate the sensor around its pitch axis for 2~3 rotations.			
6	Rotate the sensor around its roll axis for 2~3 rotations.			
7	Rotate the sensor randomly to acquire data as much as possible from different directions.			
8	The calibration procedure finished automatically after 30 seconds. After that the			
	magnetometer has been calibrated.			

Accelerometer Calibration

The misalignment of the accelerometer relative to the casing of the LPMS-CANAL device is expressed by the so called misalignment matrix. Using the LpmsControl software this misalignment matrix can be calibrated by the user. In the mean time, the offsets of the accelerometer can be also evaluated. Whereas the usage of the LpmsControl software is explained in more detail in the *"LpmsControl Software Operation"* section, the calibration procedure consists of the following steps:

Step	Description
1	If it is not already switched on, power up the LPMS-CANAL device.
2	If it is not already connected, connect to the sensor.
3	Start the accelerometer misalignment calibration using the LpmsControl software. See

	"LpmsControl Software Operation" section.			
4	Fix the sensor to a horizontal surface with the Z-axis pointing upwards.			
5	Fix the sensor to a horizontal surface with the Z-axis pointing downwards.			
6	Fix the sensor to a horizontal surface with the X-axis pointing upwards.			
7	Fix the sensor to a horizontal surface with the X-axis pointing downwards.			
8	Fix the sensor to a horizontal surface with the Y-axis pointing upwards.			
9	Fix the sensor to a horizontal surface with the Y-axis pointing downwards.			
10	After finishing the above procedures the accelerometer misalignment matrix and offset			
	values will be re-calculated. This finishes the accelerometer calibration.			

VIII. COMMUNICATION PROTOCOL

Establishing a Connection

There are two ways to communicate with LPMS-CANAL:

- 1. After powering up the sensor by default continuously streams measurement data over the CAN bus using the CANOpen protocol. For a short explanation of our CANOpen implementation please read further below. In this mode it is not necessary to send any commands to the sensor. The sensor will just send the measurement values non-stop over the CAN bus. Which values are sent, as well as the other measurement parameters can be set using the LpmControl application and then saved to the flash memory of the sensor. Please don't forget that the sensor needs to be powered down once after using LpmsControl to be returned into its default data streaming mode. Use this method, if you simply want to read data from the sensor.
- 2. More complex communication can be achieved with the LpCAN protocol. This protocol allows the user not only to read data from the sensor, but also access the sensors parameter registers and settings. Use this method, if switching between filter modes, ranges etc. is required for your application.

In this manual the LpBus and LpCAN protocol will be explained first. Please skip the next two sections, if you are just interested in reading sensor data via the CAN bus.

LpCAN Protocol

To exchange data with LPMS-CANAL via CAN bus interface based on LpCAN protocol.

A regular LpCAN message is structured as shown below:

11-bit CAN identifier	The CAN identifier of a CAN message. This identifier is set to			
	the value 514h for all LpCAN transmissions.			
8 data bytes	Contains the actual data to be transmitted in a CAN message.			

Basic Command Introduction

The communication packet has two basic command types, GET and SET, that are sent from a host (PC, mobile data logging unit etc.) to a client (LPMS-CANAL device). Later in this manual we will show a description of all supported commands to the sensor, their type, contained data etc.

GET Commands

Data from the client is read using GET requests. A GET request usually contains no data. The answer from the client to a GET request contains the requested data.

SET Commands

Data registers of the client are written using SET requests. A SET command from the host contains the data to be set. The answer from the client is an ACK command feedback for a successful write, or NACK command feedback for a failure to set the register occurred.

Data Format in a Packet Data Field

Generally data is sent in little-endian format, low order byte first, high order byte last. Data in the data fields of a packet can be encoded in several ways, depending on the type of information to be transmitted. In the following we list the most common data types. Other command-specific data types are explained in the command reference.

Transmission order	0	1	2	3	
Integer word, byte number	0 (LSB)	1	2	3 (MSB)	
32-bit integer 3-component vector (LENGTH = 12 bytes)					
Transmission order	0	1	2	3	
Vector component 1, byte number	0 (LSB)	1	2	3 (MSB)	
Transmission order	4	5	6	7	
Vector component 2, byte number	0 (LSB)	1	2	3 (MSB)	
Transmission order	8	9	10	11	
Vector component 3, byte number	0 (LSB)	1	2	3 (MSB)	

32-bit integer values (LENGTH = 4 bytes)

32-bit float value encoded as integer (LENGTH = 4 bytes)

Transmission order	0	1	2	3
Integer-encoded float, byte number	0 (LSB)	1	2	3 (MSB)

32-bit float 3-component vector (LENGTH = 12 byte)

Transmission order	0	1	2	3
Vector component 1, byte number	0 (LSB)	1	2	3 (MSB)
Transmission order	4	5	6	7
Vector component 2, byte number	0 (LSB)	1	2	3 (MSB)
Transmission order	8	9	10	11

Vector component 3, byte number	0 (LSB)	1	2	3 (MSB)
---------------------------------	---------	---	---	---------

Packet Format

An example packet with 4 data bytes showed in the following CAN messages:

CAN Message #1:

Byte no.	Name	Description		
0	Packet start (3Ah)	Mark of the beginning of a data packet.		
1	OpenMATID	Contains the low byte of the OpenMAT ID of the sensor to be		
	byte 1	communicated with. The default value of this ID is 1. The host		
		sends out a GET / SET request to a specific LPMS-CU sensor by		
		using this ID, and the client answers to request alsowith the same		
		ID. This ID can be adjusted by sending a SET command to the		
		sensor firmware.		
2	OpenMAT ID	High byte of the OpenMAT ID of the sensor.		
	byte 2			
3	Command no.	Contains the low byte of the command to be performed by the		
	byte 1	data transmission.		
4	Command no.	High byte of the command number.		
	byte 2			
5	Packet data length	Contains the low byte of the packet data length to be transmitted		
	byte 1	in the packet data field (in this example 4)		
6	Packet data length	High byte of the data length to be transmitted (in this example 0)		
	byte 2			
7	Packet data	Packet data byte 0		

CAN Message #2:

Byte no.	Name	Description	
0	Packet data	Packet data byte 1	
1	Packet data	Packet data byte 2	
2	Packet data	Packet data byte 3	
3	LRC byte 1	The low byte of LRC check-sum.	
4	LRC byte 2	High byte of LRC check-sum.	
5	Termination byte 1	0Dh	
6	Termination byte 2	0Ah	
7	Not used	0	

The number of messages needed to contain the data depends on the length of the data to be transmitted. The last message of a set is truncated to be just long enough to transport all of the remaining data (in the example 7 bytes). The unused bytes of a message are filled up with 0.

CANOpen Protocol

After the sensor is powered-up, it will by default start streaming sensor data in CANOpen format. Our CANOpen implementation consists of 4 TPDO (Transmission Data Process Object) messages and a heartbeat message that are transmitted over the CAN bus. Sensor data can be assigned to specific messages using the LpmsControl application. The frequency of the CANOpen heartbeat message is adjustable between 0.1 Hz and 2 Hz. For details on how to adjust parameters using LpmsControl, please see the next chapter.

CANOpen data is continuously sent from the sensor to the host with the streaming frequency selected in the LpmsControl application at the selected baudrate. The data to be transmitted can be selected to adjust the bus bandwidth used by the LPMS system. All transmitted values are in IEEE754 32-bit integer encoded floating point format. Please see an overview of the CANOpen messages below:

Message ID	Description
180h + IMU ID	CANOpen TPDO 1. Freely assignable. Data in IEEE754 format.
280h + IMU ID	CANOpen TPDO 2. Freely assignable. Data in IEEE754 format.
380h + IMU ID	CANOpen TPDO 3. Freely assignable. Data in IEEE754 format.
480h + IMU ID	CANOpen TPDO 4. Freely assignable. Data in IEEE754 format.
700h + IMU ID	If the sensor is in operational state, this message contains one
	byte with value 5h. If the sensor is stopped due to an error, the
	value is 4h.

Protocol Commands List

If a user connects to LPMS-CANAL using LpCAN protocol, he can access the sensor functionality using the commands in the list below.

Acknowledged and Not-acknowledged Identifier

Command No.	Command description
(decimal values)	
0	REPLY_ACK (acknowledged). Confirms a successful SET command.
1	REPLY_NACK (not-acknowledged) Reports an error during processing a SET command.

Firmware Update and In-Application-Programmer Upload Command

Start the firmwar	e update process.			
IMPORTANT:	By not correctly uploading a firmware file the sensor might become			
in-operable. In normal cases please use the LpmsControl software to upload new				
firmware. Also please only use firmware packages that have been authorized by				
LP-RESEARCH				
Packet data:	Firmware data			
Data format	Firmware binary file separated into 256 byte			
	chunks for each update packet.			
Macro name:	UPDATE_FIRMWARE			
Response:	Response: ACK (success) or NACK (error) for each			
	transmitted packet.			
"RESERVED"	This command is reserved by LP-RESEARCH.			
Start the in-application programmer (IAP) update process.				
Packet data:	IAP data			
Data format IAP binary file separated into 256 byte				
chunks for each update packet.				
Macro name:	Macro name: UPDATE_IAP			
Response:	ACK (success) or NACK (error) for each			
	transmitted packet.			
	in-operable. In firmware. Also LP-RESEARCH Packet data: Data format Macro name: Response: "RESERVED" Start the in-appli Packet data: Data format Macro name:			

Configuration and Status Command

4	Get the current value	of the confi	guration register of the sensor. The configuration word	
	can ONLY be read. The different parameters are set by their respective SET commands.			
	E.g. SET_TRANSMIT	E.g. SET_TRANSMIT_DATA for defining which data is transmitted from the sensor.		
	Packet data:	Configuration word. Each bit represents the state of one		
		configura	ation parameter.	
	Return format:	32-bit integer		
		Bit	Reported State / Parameter	
		0 - 2	Stream frequency setting (see	
			SET_STREAM_FREQ)	
		3 - 8	Reserved	
		9	Pressure data transmission enabled	
		10	Magnetometer data transmission enabled	
		11	Accelerometer data transmission enabled	
		12	Gyroscope data transmission enabled	
		13	Temperature output enabled	
		14	Heave motion output enabled	
		15	Reserved	
		16	Angular velocity output enabled	
		17	Euler angle data transmission enabled	
		18	Quaternion orientation output enabled	
		19	Output enabled	
		20	Dynamic magnetometer correction enabled	
		21	Linear acceleration output enabled	
		22	Reserved	
		23	Gyroscope threshold enabled	
		24	Magnetometer compensation enabled	
		25	Accelerometer compensation enabled	
		26	Reserved	
		27	Reserved	
		28	Reserved	
		29	Reserved	
		30	Gyroscope auto-calibration enabled	
		31	Reserved	
	Macro name:	GET_CC	DNFIG	

5	Get the current value	of the status	register of the LPMS-CANAL device. The status word	
	can ONLY be read.			
	Packet data:	Status indicator. Each bit represents the state of one status		
		parameter		
	Return format:	32-bit integer		
		Bit	Indicated state	
		0	COMMAND mode enabled	
		1	STREAM mode enabled	
		2	SLEEP mode enabled	
		3	Gyroscope calibration on	
		4	Reserved	
		5	Gyroscope initialization failed	
		6	Accelerometer initialization failed	
		7	Magnetometer initialization failed	
		8	Pressure sensor initialization failed	
		9	Gyroscope unresponsive	
		10	Accelerometer unresponsive	
		11	Magnetometer unresponsive	
		12	Flash write failed	
		13	Reserved	
		14	Set broadcast frequency failed	
		15-31	reserved	
	Macro name:	GET_STA	ATUS	

Mode Switching Command

6	Switch to command mode. In command mode the user can issue commands to the			
	firmware to perform calibration, set parameters etc.			
	Packet data: none			
	Macro name: GOTO_COMMAND_MODE			
	Response: ACK (success) or NACK (error)			
7	Switch to streaming mode. In this mode data is continuously streamed from the sensor,			
	and all other commands cannot be performed until the sensor receives the			
	GOTO_COMMAND_MODE command.			
	Packet data: none			

	Macro name:	GOTO_STREAM_MODE	
	Response:	ACK (success) or NACK (error)	
8	Switch to sleep mode. The purpose of the sleep mode is to reduce the power consumption		
	of the sensor. Once in sleep mode, no commands can be issued to the sensor until it is		
	woken up by switching back into command mode or streaming mode.		
	Packet data: none		
	Macro name: GOTO_SLEEP_MODE		
	Response:	ACK (success) or NACK (error)	

Data Transmission Command

9	Get the latest set of se	ensor data. The	e format of the sensor d	lata depends on the transmission			
	settings (SET_TRANSMIT_DATA). The currently set format can be retrieved with the						
	sensor configuration v	sensor configuration word.					
	IMPORTANT: In the current version of the firmware calibrated accelerometer data as well						
	as calibrated magneto	meter data wil	ll always be transmitte	d. As these values are necessary			
	for the calibration of the sensor, they can at the moment not be switched off.						
	This format is also us	sed in streamir	ng mode to continuous	sly send data from the sensor to			
	the host.						
	Packet data:	Sensor data	a. The data always has	the same order. Depending on			
		the enabled	d transmission data, ch	unks are inserted or left out.			
	Return format:	Raw senso	r data chunk				
		Chunk	Data type	Sensor data			
		number					
		1	Float	Timestamp (ms)			
		2	Float 3-vector	Calibrated gyroscope data			
				[deg/s]			
		3	Float 3-vector	Calibrated accelerometer			
				data [m/s ²]			
		4	Float 3-vector	Calibrated magnetometer			
				data [µT]			
		5	Float 3-vector	Angular velocity [deg/s]			
		6	Float 4-vector	Orientation quaternion			
				[normalized]			
		7	Float 3-vector	Euler angle data [deg.]			
		8	Float 3-vector	Linear acceleration data			

				$[m/s^2]$	
		9	Float		
		9	Float	Barometric pressure	
		10		[mPa]	
		10	Float	Heave motion [m] (if	
				enabled)	
	Macro name:	GET	_SENSOR_DATA		
10	Set the data that is	transmitted	from the sensor in str	eaming mode or when retrieving dat	
	through the GET_S	SENSOR_D	ATA command.		
	Packet data:	Data sele	ection indicator		
	Data format:	32-bit in	teger. The flags to swi	itch data chunks on (set the bit to 1)	
		and off ((set the bit to 0) are th	e same as in the configuration word	
		(see SET	C_CONFIG).		
		Bit	Reported State / I	Parameter	
		9	Pressure data trans	mission enabled	
		10	Magnetometer data transmission enabled		
		11	Accelerometer data transmission enabled		
		12	Gyroscope data tra	nsmission enabled	
		13	Temperature output	Temperature output enabled	
		14	Heave motion outp	Heave motion output enabled	
		16	Angular velocity output enabled		
		17	Euler angle data tr	ansmission enabled	
		18	Quaternion orienta	tion output enabled	
		19	Altitude output ena	abled	
		21	Linear acceleration	n output enabled	
	Macro name:	SET_TRANSMIT_DATA			
	Response:				
	Default value:			gnetometer and quaternion data.	
	Set the timing in which streaming data is sent to the host. Please note the

		50	50	
		100	100	
		200	200	
		300	300	
		500	500	
	Macro name:	SET_STREAM_FREQ	·	
	Response:	ACK (success) or NACK (error)		
	Default value:	100 Hz		
12	Get the current roll angle in radians.			
	Packet data:	Roll angle		
	Return format:	32-bit integer coded float value.		
	Macro name:	GET_ROLL		
13	Get the current pitcl	n angle in radians.		
	Packet data:	Pitch angle		
	Return format:	32-bit integer coded float value.		
	Macro name:	GET_PITCH		
14	Get the current yaw	angle in radians.		
	Packet data:	Yaw angle		
	I achet uata.			
	Return format:	32-bit integer coded float value.		

Register Value Save and Reset Command

15	Write the current	Write the currently set parameters to flash memory.		
	Packet data:	Packet data: None		
	Macro name:	WRITE_REGISTERS		
	Response:	ACK (success) or NACK (error)		
16	Reset the LPMS parameters to factory default values. Please note that upon issuing this			
	command your c	command your currently set parameters will be erased.		
	Packet data:	none		

Macro name:	RESTORE_FACTORY_VALUE
Response:	ACK (success) or NACK (error)

Reference Setting and Offset Reset Command

17	Set the acceleron	neter and magnetometer reference vectors.
	Packet data:	None
	Macro name:	RESET_REFERENCE
	Response:	ACK (success) or NACK (error)
18	Set the orientation	on offset (the value that is subtracted from the acquired orientation value
	after a measurem	ent) to the currently measured orientation. This effectively resets the zero
	orientation of the	e sensor to the current orientation.
	Packet data:	none
	Macro name:	SET_OFFSET
	Response:	ACK (success) or NACK (error)

Self-Test Command

19	Initiate the self-test. During the self test the sensor automatically rotates about the three			
	room axes. To	room axes. To simulate realistic circumstances an artificial offset is applied to the		
	magnetometer an	d the gyroscope values.		
	Packet data:	none		
	Macro name:	Macro name: SELF_TEST		
	Response:	ACK (success) or NACK (error)		

IMU ID Setting Command

20	Set the OpenMAT I	D of the LPMS-CANAL.	
	Packet data:	OpenMAT ID	
	Data format:	32-bit integer	
	Macro name:	SET_IMU_ID	
	Response:	ACK (success) or NACK (error)	
	Default value:	1	
21	Get the ID (OpenM	AT ID) of the device	
	Packet data:	The ID of the IMU device	
	Return format:	32-bit integer	
	Macro name:	GET_IMU_ID	

r

Gyroscope Settings Command

22	Start the calibrati	on procedure of t	he gyroscope	e sensor. Deta	ils of the gyroscope
	calibration procedu	are described in t	he Operation	– Calibration 1	Methods section of this
	manual. The calibr	ation takes about 5s.			
	Packet data:	none			
	Macro name:	START_GYR_C	ALIBRATION	J	
	Response:	ACK (success) or NACK (error)			
23	Enable or disable auto-calibration of the gyroscope.				
	Packet data:	Gyroscope auto-c	alibration ena	ble / disable id	entifier
	Format:	32-bit integer			
		State	Value		
		Disable	0x0000	00000	
		Enable	0x0000	00001	
	Macro name:	ENABLE_GYR_	AUTOCAL		
	Response:	ACK (success) or	r NACK (error	r)	
	Default value:	Disable			
24	Enable or disable g	gyroscope threshold.			
	Packet data:	Gyroscope thresh	old enable / d	isable identifier	r
	Format:	32-bit integer			
		State	Value		
		Disable	0x0000	00000	
		Enable	0x0000	00001	
	Macro name:	ENABLE_GYR_THRES			
	Response:	ACK (success) or	r NACK (error	r)	
	Default value:	Disable			
25	Set the current range	ge of the gyroscope.			
	Packet data:	Gyroscope range	identifier		
	Format:	32-bit integer			
		Range (deg/s)		Identifier	
		250		250	
		500		500	
		2000		2000	

	Macro name:	SET_GYR_RANGE
	Response:	ACK (success) or NACK (error)
	Default value:	2000 deg/s
26	Get current gyrosco	pe range.
	Packet data:	Gyroscope range indicator
	Return format:	32-bit integer
	Macro name:	GET_GYR_RANGE

Accelerometer Settings Command

27	Set the acceleromet	er bias.
	Packet data:	Accelerometer bias (X, Y, Z-axis)
	Format:	32-bit integer encoded float 3-component vector
	Macro name:	SET_ACC_BIAS
	Response:	ACK (success) or NACK (error)
	Default value:	(0.0, 0.0, 0.0)
28	Get the current acce	elerometer bias vector.
	Packet data:	Accelerometer bias vector
	Return format:	32-bit integer encoded float 3-component vector
	Macro name:	GET_ACC_BIAS
29	Set the acceleromet	er alignment matrix.
	Packet data:	Alignment matrix
	Format:	32-bit integer encoded float 3 x 3 matrix
	Macro name:	SET_ACC_ALIG
	Response:	ACK (success) or NACK (error)
	Default value:	3x3 Identity matrix
30	Get the current acce	elerometer alignment matrix.
	Packet data:	Accelerometer alignment matrix
	Return format:	32-bit integer encoded float 3 x 3 matrix
	Macro name:	GET_ACC_ALIG
31	Set the current rang	e of the accelerometer.
	Packet data:	Accelerometer range identifier

	Format:	32-bit integer		
		Range (g: 1 gravity)	Identifier	
		2g	2	
		4g	4	
		8g	8	
		16g	16	
	Macro name:	SET_ACC_RANGE		
	Response:	ACK (success) or NACK (error)		
	Default value:	2g		
32	Get current accelero	meter range.		
	Packet data:	Accelerometer range indicator		
	Return format:	32-bit integer		
	Macro name:	GET_ACC_RANGE		

Magnetometer Settings Command

33	Set the current range of the magnetometer.					
	Packet data:	Magnetometer range identifier				
	Format:	32-bit integer				
		Range	Identifier			
		130 uT	130			
		190 uT	190			
		250 uT	250			
		400 uT 470 uT 560 uT	400			
			470			
			560			
		810 uT	810			
	Macro name:	SET_MAG_RANGE				
	Response:	ACK (success) or NACK (error) 250 uT				
	Default value:					
34	Get current magnetometer range.					
	Packet data:	Magnetometer range indicator (same as above)				
	Return format:	32-bit integer				
	Macro name:	GET_MAG_RANGE				
35	Set the current hard	l iron offset vector.				

	Packet data:	Hard iron offset values in uT 32-bit integer encoded 3-element float vector				
	Format:					
	Macro name:	SET_HARD_IRON_OFFSET ACK (success) or NACK (error)				
	Response:					
	Default value:	(0.0, 0.0, 0.0)				
36	Get current hard iron offset vector.					
	Packet data:	Hard iron offset values in uT				
	Return format:	32-bit integer encoded 3-element float vector				
	Macro name:	GET_HARD_IRON_OFFSET				
37	Set the current soft iron matrix.					
	Packet data:	Soft iron matrix values in uT				
	Format:	32-bit integer encoded 9-element (3x3) float matrix				
	Macro name:	SET_SOFT_IRON_MATRIX				
	Response:	ACK (success) or NACK (error)				
	Default value:	(1, 0, 0)				
		(0, 1, 0)				
		(0, 0, 1)				
38	Get the current soft iron matrix.					
	Packet data:	Soft iron matrix values in uT				
	Return format:	32-bit integer encoded 9-element (3x3) float matrix				
	Macro name:	GET_SOFT_IRON_MATRIX				
39	Set the current earth magnetic field strength estimate.					
	Packet data:	Field estimate value in uT				
	Format:	32-bit integer encoded float				
	Macro name:	SET_FIELD_ESTIMATE				
	Response:	ACK (success) or NACK (error)				
	Default value:	50 uT				
40	Get the current earth magnetic field strength estimate.					
	Packet data:	Field estimate value in uT				
	Return format:	32-bit integer encoded float				
	Macro name:	GET_FIELD_ESTIMATE				
	Traver o humer					

41	Settings command Setthe sensor filter mode.					
	Packet data:Mode identifierFormat:32-bit integer					
		Mode V		lue		
		Gyroscope only	0x	.0000000		
		Accelerometer +	0x	00000001

		Magnetometer (Euler				
		angle based filtering)				
		Accelerometer +	0x00000004			
		Gyroscope (Euler				
		angle-based filtering)				
	Macro name: SET_FILTER_MODE					
	Response:	se: ACK (success) or NACK (error)				
	Default value:	value: Accelerometer + gyroscope				
42	Get the currently selected filter mode.					
	Packet data:	Filter mode identifier				
	Return format:	32-bit integer				
		Mode		Value		
		Gyroscope only		0x0000000		
		Accelerometer	+	0x00000001		
		gyroscope				
		Accelerometer	+	0x0000002		
		gyroscope	+			
		magnetometer				
	Macro name:	GET_FILTER_MODE				
43	Set one of the filter j	parameter presets.				
	Packet data: Magnetometer correction strength preset identifier					
	Format:	32-bit integer				
		Preset	Value			
----	---	-------------------------	-------------------------------	---		
		Dynamic	0x0000000			
		Strong	0x00000001			
		Medium	0x0000002			
		Weak	0x0000003			
	Macro name:	SET_FILTER_PRESET				
	Response:	ACK (success) or NACK ((error)			
	Default value:	Dynamic				
44	Get the currently magnetometer correction strength preset					
	Packet data:	Magnetometer correction	on strength preset identifier			
	Return format:	32-bit integer				
		Correction strength	Value			
		Dynamic	0x0000000			
		Strong	0x0000001			
		Medium	0x0000002			
		Weak	0x0000003			
	Macro name:	GET_FILTER_PRESE]		

CAN Bus Settings Command

45	SetCAN stream format. This command has been deprecated.			
46	Set the CAN baudra	ite		
	Packet data:	CAN communication baudrate		
	Format:	32-bit integer		
		Correction strength	Value	
		10Kbit/s	0x0000000

	Macro name:	RESET_TIMESTAMP
	Response:	ACK (success) or NACK (error)
	Default value:	none

IX. OpenMAT

Overview

Introduction

OpenMAT is the software package delivered with a LPMS device. The package contains the basic hardware device drivers for the sensors, a C++ library to easily access the functionality of the IMUs and also a network interface (OpenMAT network) that allows applications to communicate with each other to exchange sensor information. OpenMAT consists of the following components:

- LpSensor library: OpenMAT applications above are based on the LpSensor library. This library
 contains classes that allow easy access to the functionality of the LPMS devices. Contained
 classes and their most important methods as well as usage examples are described further on in
 this chapter.
- LpmsControl application: This application is used to control the basic LPMS device functionality. It can be used to connect to multiple sensors, adjust parameters and record sample data. Data is graphically represented as line graphs or as a 3D cube that changes orientation according to the data received from a sensor.

PLEASE NOTE: LpmsControl is also used to do updates of the LPMS firmware. We will explain further details below. IMPORTANT: We recommend the users to use the high performance mode of a PC in order to guarantee the LpmsControl application performance.

 OpenMAT server: The OpenMAT server manages the communication of applications on the OpenMAT network. Please contact LP-Research for examples of how to use the OpenMAT network.

OpenMAT is available as binary release and as source code release. If you would like to use the included applications as is, please use the binary release. This is suggested as the easiest way to start as it allows you to test the functionality of your sensor.

We also offer a source code release that allows you to re-compile or modify the code. In case you would like to include OpenMAT with your own applications it is recommended to take a look at the source code release.

Application Installation

Please follow the steps below to install the OpenMAT binary release. The binary release also includes the OpenMAT API pre-compiled for Windows 32-bit.

- When you purchase one of our sensors the latest version of the library at the time is also contained on the included CD. Please be aware that development on OpenMAT is ongoing and therefore the version on the CD might become outdated. Therefore please check on our website for updates.
- 2. Start OpenMAT-x.x.x-Setup.exe (x.x.x being the latest version number).
- 3. Follow the displayed installation instructions.
- 4. Switch the LPMS device on.
- 5. Start LpmsControl from the OpenMAT entry in the start menu.
- 6. Check if your device is listed in the 'Discovered devices' list.
- 7. Mark the device you would like to connect to by clicking on it in the list and push the connect button.
- 8. After a few seconds you should be seeing data being streamed from your sensor.

LpmsControl Software Operation

Overview

The LpmsControl application allows users to control various aspects of the LPMS-CANAL sensor that can be used to:

- List all LPMS devices that are discovered in the system.
- Adjust the sensor parameters (sensor range etc.).
- Reset orientation and reference vectors.
- Initiate gyroscope and magnetometer calibration.
- Adjust the accelerometer misalignment matrix.
- Display the acquired data in real-time either as line graphs or a 3D cube.
- Record data from the sensors to a CSV data file.
- Upload new firmware and in-application-programming software to the sensor.

As LpmsControl is part of the open-source OpenMAT package its source code is available and can be modified by the user. Most parts of the code are documented, so that a user can also use parts of LpmsControl to write their own sensor control code.

GUI Elements

Application window

<u>Menu Bar</u>

introdued in section "Calibration Methods")

Calibrate magnetometer – Starts the magnetic calibration (users should follow the insturctions introdued in section "*Calibration Methods*"). IMPORTANT: Euler angle transmission must be turned on for the magnetometer calibration to succeed.

Calibrate acc. misalignment– Starts the accelerometer calibration. (users should follow the insturctions introdued in section "*Calibration Methods*").

Calibrate gyr. misalignment- reserved by LP-RESEARCH.

Save parameters to sensor – Saves the current parameter settings and calibration results into the sensor flash.

Save parameters to file – Saves the current parameter settings and calibration results into a .txt file in your local host system.

Load parametersfromfile – Loads the previouslysaved calibration results in a local txt file into the sensor flash.

Reset heading (selected)– Sets themagnetometer and accelerometer reference of the LP-Filter of the currenly selected sensor in the "Connected devices" list to the current measured magnetic

and acceleration vector. This function should be used after calibrating the magnetometer.

Reset heading (all)– Sets themagnetometer and accelerometer reference of the LP-Filter of all the sensors in the "Connected devices" list to the current measured magnetic and acceleration vector. This function should be used after calibrating the magnetometer.

Reset offset (selected) - Resets the current orientation of the selected sensor in the "Connected devices" list as zero-orientation. Further rotations will be the difference rotation between the zero-orientation and the currently measured orientation.

Reset offset (all) - Resets the current orientation of all the sensors in the "Connected devices" list as zero-orientation. Further rotations will be the difference rotation between the zero-orientation and the currently measured orientation.

Reset to factory settings – Recovers the settings of all the connected sensors to the factory default values.

😳 OpenMAT LPMS Control		
Connect Measurement Calibration	OpenMAT View Expert	
Sensor Control	Connect to OpenMAT server	
Discovered devices	Version info	OnonMAT monu
· _ · · ·		OpenMAT menu

Connect to OpenMAT server - This is used for human model simulator. The human model simulator allows the construction of 3D models with links and joints that can be associated with orientation sensors on the OpenMAT network. Momentarily this application is still in an experimental state. PLEASE NOTE: This function is reserved by LP-RESEARCH. **Version info** – Version information of the LpmsControl software.

Graph window- Switches the middle graph window to show the raw sensor data. **Orientation window** – Switches the middle graph window to show the orientation data. **Pressure window** - Switches the middle graph window to show the pressure data.

3D visualization - Switches the middle graph window to 3D cube view.

Magnetic field map – Switches the middle graph window to magnetic field map view.

3D view mode 1 - Switches the middle graph window to 1 window for one sensor 3D visualization.
3D view mode 2 - Switches the middle graph window to 2 windows for 2 sensors 3D visualization.
3D view mode 4 - Switches the middle graph window to 4 windows for 4 sensors 3D visualization.

Preferred devices:	✓×+∎≋	Upload firmware Upload IAP	
-		Start self test	Expert menu
Connected devices			і іздрегі піспи

Upload firmware - Starts firmware upload. IMPORTANT: Only upload authorized firmware that you received from LP-RESEARCH. Uploading a wrong firmware file can make the sensor in-operable.

Upload IAP- Uploads a new in-application programmer.PLAESENOTE: This is reserved by LP-RESEARCH and should not be used by user.

Start self test- Starts a self test for checking the basic functionalities of the sensor.

Device Discovery

Discovery can be re-started by clicking on the "Scan devices" button. If the LPMS-CANAL device cannot be discovered by the initial discovering, please try to push the "Scan devices" button and search again.

IMPORTANT: After you plug-in the LPMS-CANAL to your PC, it takes a few seconds until Windows will correctly recognize the device. During that period the device might not be discoverable by the LpmsControl application.

Connecting and Disconnecting a Device

To connect a LPMS-CANAL sensor click on the corresponding item in the "Preferred devices" list and click the "Connect" button. The sensor should now become listed in the "Connected devices" list. While establishing the connection, the 'Connection status' indicator shows 'connecting...'. Once a connection has been successfully established, the connection status will change to 'connected'. The sensor will start measuring automatically after connecting. Should the connection procedure fail for some reason, 'failed' will be displayed. If a successful connection is interrupted the connection status will change to 'connection interrupted'.

Sensor Parameter Adjustment

Sensor parameters can be adjusted using the item in the connected sensors list that corresponds to the target device. Using the drop down lists the following parameters can be set:

• **IMU ID**: The device OpenMAT ID.

- **Sampling rate**: System sampling frequency
- GYR range: Gyroscope measurement range
- ACC range: Accelerometer measurement range
- MAG range: Magnetometer measurement range
- Filter mode: The filter mode setting (see also the previous section "Filter Settings")
- Mag. correction: The magnetic correction setting (see also the previous section "*Filter Settings*")
- Linear acc cor.: The linear acceleration correction setting (see also the previous section *"Filter Settings"*)
- **Rotational acc cor**.: The linear rotational correction setting (see also the previous section *"Filter Settings"*)
- **Gyr. threshold**: To enable or disable the gyroscope threshold function (see also the previous section *"Filter Settings"*)
- **Gyr. autocalibration**: To enable or disable the gyroscope auto calibration function (see also the previous section "*Filter Settings*")
- **Low-pass filter**: To set up the coefficient of the low pass filter (see also the previous section *"Filter Settings"*)
- CAN baudrate: Selects the baudrate used for CAN bus communication.
- **CANopen heartbeat**: Selects the frequency with which the CANOpen heartbeat is transmitted from the sensor.
- TPDO 0 4 data setting: Selects the data to be transmitted via the CANOpen TPDOs. Angular velocity, orientation in Euler angles, orientation quaternion, linear acceleration and raw accelerometer and magnetometer data can be sent.
- Selected data: check the data types you want to acquire.

Parameter adjustments are normally only persistent until the sensor is switched off. You can permanently save the newly adjusted parameters to the LPMS flash memory by selecting "Save parameters to sensor" in the "Calibration" menu of LpmsControl.

Reset of Orientation and Reference Vectors

The offset of the orientation measured by the sensor can be set to the currently acquired orientation by clicking on the "Reset offset" functions of LpmsControl. The newly reported orientation data will be the orientation difference between this zero-orientation and the un-adjusted (raw) orientation measurement.

The accelerometer and magnetometer reference vector is reset by clicking on the "Reset heading" function of LpmsControl. Before resetting the heading reference, PLEASSE DO complete the

magnetic calibration. While initiating the heading reference reset, point the y axis of the sensor roughly in north direction and hold the x-y plane of the sensor parallel to the ground.

IMPORTANT: The adjustment of the heading reference vectors is very important for accurate orientation measurements. The sensor will be delivered to you in a pre-calibrated state. However, as the direction of the earth magnetic field slightly varies at different place, it might be necessary to reset the reference. To save the new heading reference after a successful reset, select "Save parameters to sensor" function of LpmsControl. Normally the setting of the heading reference vectors when done accurately only needs to be done once.

How to Upload New Firmware

IMPORTANT: Please follow the following steps carefully when you are updating the sensor firmware. Any mistake operation might result in a failure of firmware update and disable sensor functionality.

- 1. Start your current LpmsControl software.
- 2. Connect to the sensor you would like to update.
- 3. Choose the "Save parameters to file" function from the calibration menu of LpmsControl to save the current sensor calibration results into a .txt file in your local host system.
- 4. Select "Upload firmware" function in the "Expert" menu.
- 5. Click OK and select the new firmware file. Be careful that you select the right file which should be named as LpmsCANALFirmwareX.X.X.bin by LP-RESEARCH.
- 6. Wait for the upload process to finish. It should take around 30 seconds. At around 15s the green LED on the sensor should begin to blink rapidly.
- 7. Disconnect from the sensor and exit LpmsControl.
- 8. Now install the new LpmsControl application. The previous LpmsControl application does not need to be un-installed.
- 9. Start LpmsControl and connect to your sensor.
- 10. Choose the "Load parameters fromfile" function from the calibration menu of LpmsControl to recover the previous sensor calibration results.
- 11. Choose the "Save parameters tosensor" function from the calibration menu of LpmsControl to save the previous sensor calibration results into sensor flash.
- 12. The whole procedure is done. Make sure everything works as expected. If there is anything unexpected, please contact LP-RESEARCH by Email: info@lp-research.com.

The LpSensor Library

Building Your Application

The LpSensor library contains classes that allow a user to integrate LPMS devices into their own

applications. The library is a Windows 32-bit C++ library for MS Visual C++ (express) 2010. Should you require a binary for the library for other operating systems or 64-bit applications, please contact LP-RESEARCH.Compiling applications that use the LpSensor library requires the following components:

Header files (usually in C:/OpenMAT/include)

LpmsSensorManagerI.h	Contains the interface for the LpmsSensorManager class.	
LpmsSensorI.h Contains the interface for the LpmsSensor class		
ImuData.h	Structure for containing output data from a LPMS device	
LpmsDefinitions.h	Macro definitions for accessing LPMS	
DeviceListItem.h	Contains the class definition for an element of a LPMS device list	

LIB files (usually in C:/OpenMAT/lib/x86)

LpSensorD.lib	LpSensor library (Debug version)
LpSensor.lib	LpSensor library (Release version)

DLL files (usually in C:/OpenMAT/lib/x86)

LpSensorD.dll	LpSensor library (Debug version)
LpSensor.dll	LpSensor library (Release version)

PCANBasic.dll	PeakCAN library DLL for CAN interface communication. This file is	
only needed, if you use a PeakCAN interface to communicate with LPMS-CU.		
ftd2xx.dll	The FTDI library to communicate with an LPMS over USB.	

To compile the application please do the following:

- 1. Include LpmsSensorManagerI.h before you access any LpSensor classes.
- 2. Add LpSensor.lib (or LpSensorD.lib if you are compiling in debug mode) to the ist of linked libraries for your application.
- 3. Make sure that you set a path to LpSensor.dll / LpSensorD.dll, PCANBasic.dll and ftd2xx.dll reside so that the runtime file of your application can access them.

Important Classes

SensorManager

The sensor manager class wraps a number of LpmsSensor instances into one class, handles device discovery and device polling. For user applications the following methods are most commonly used. Please refer to the interface file SensorManagerI.h for more information.

IMPORTANT: An instance of LpmsSensor is returned by the static function **LpmsSensorManagerFactory**(). See the example listing in the next section for more information how to initialize a LpmsSensorManager object.

Method name	SensorManager(void)
Parameters	none
Returns	SensorManager object
Description	Constructor of a SensorManager object.

Method name	LpSensor	<pre>* addSensor(int mode,</pre>	string deviceId)
Parameters	mode The device type to be connected. The following device		
		types are available:	
		Macro	Device type
		DEVICE_LPMS_B	LPMS-B
		DEVICE_LPMS_C	LPMS-CU (CAN mode)
		DEVICE_LPMS_U	LPMS-CU (USB mode)
	deviceId	Device ID of the LPMS device.	The ID is equal to the
		OpenMAT ID (initially set to 1	, user definable).
Returns	Pointer to LpSensor object.		
Description	Adds a sensor device to the list of devices adminstered by the		
	SensorManager object.		
Method name	void removeSensor(LpSensor *sensor)		
Parameters	sensor	Pointer to LpSensor object that	t is to be removed from the
		list of sensors. The call to remo	oveSensor frees the memory
		associated with the LpSensor of	bject.
Returns	none		
Description	Removes a c	levice from the list of currently	administered sensors.

Method name	<pre>void listDevices(std::vector<devicelistitem> *v)</devicelistitem></pre>	
Parameters	*v Pointer to a vector containing DeviceListItem objects with	
	information about LPMS devices that have been discovered	
	by the method.	
Returns	None	
Description	Lists all connected LPMS devices. The device discovery runs in a	

seperate thread.For Bluetooth devices should take several seconds to be
added to the devicelist. CAN bus and USB devices should be added after
around 1s.

LpmsSensor

This is a class to access the specific functions and parameters of an LPMS. The most commonly used methods are listed below. Please refer to the interface file LpmSensorI.h for more information.

Method name	void run (void)
Parameters	None
Returns	None
Description	Starts the data acquisition procedure.

Method name	void pause (void)
Parameters	None
Returns	None
Description	Pauses the data acquisition procedure.

Method name	int getSensorStatus(void)	
Parameters	None	
Returns	Sensor state identifier:	
	Масто	Sensor state
	SENSOR_STATUS_PAUSED	Sensor is currently paused.
	SENSOR_STATUS_RUNNING	Sensor is currently acquiring
		data.
	SENSOR_STATUS_CALIBRATING	Sensor is currently calibrating.
	SENSOR_STATUS_ERROR	Sensor has detected an error.
	SENSOR_STATUS_UPLOADING	Sensor is currently receiving
		new firmware data.
Description	Retrieves the current sensor status.	

Method name	int getConnectionStatus(void)
Parameters	None

Returns	Connection status identifier:	
	Масто	Sensor state
	SENSOR_CONNECTION_CONNECTED	Sensor is connected.
	SENSOR_CONNECTION_CONNECTING	Connection is currently
		being established.
	SENSOR_CONNECTION_FAILED	Attempt to connect has
		failed.
	SENSOR_CONNECTION_INTERRUPTED	Connection has been
		interrupted.
Description	Retrieves the current connection status.	

Method name	void startResetReference(void)	
Parameters	None	
Returns	None	
Description	Resets the current accelerometer and magnetometer reference. Please see	
	the 'Operation' chapter for details on the reference vector adjustment	
	procedure.	

Method name	void startCalibrateGyro(void)
Parameters	None
Returns	None
Description	Starts the calibration of the sensor gyroscope.

Method name	void startCalibrateMag(void)	
Parameters	None	
Returns	None	
Description	Starts the calibration of the LPMS magnetometer.	

Method name	CalibrationData* getConfigurationData(void)
Parameters	None
Returns	Pointer to CalibrationData object.
Description	Retrieves the CalibrationData structure containing
	the configuration parameters of the connected LPMS.

Method name bool setConfigurationPrm(int parameterIndex, int
--

	parameter)					
Parameters	parameterIndex	The param	eter to be adjusted.			
	parameter	The new p	arameter value.			
	Supported parameterInd	Supported parameterIndex identifiers:				
	Macro		Description			
	PRM_OPENMAT_ID		Sets the current OpenMAT ID.			
	PRM_FILTER_MODE		Sets the current filter mode.

	Integer ID numbe PRM_FILTER_MODE Macro FM_GYRO_ONLY FM_GYRO_ACC FM_GYRO_ACC_MAG PRM_PARAMETER_SE Macro		1 and 255. Description Only gyroscope Gyroscope + accelerometer Gyroscope + accelerometer + magnetometer Description			

	LPMS_FILTER_PRM_SET_3	Medium
	LPMS_FILTER_PRM_SET_4	Weak
	PRM GYR THRESHOLD ENABLE	
	Macro	Description
	IMU_GYR_THRESH_DISABLE	Enable gyr. threshold
	IMU_GYR_THRESH_ENABLE	Disable gyr. thershold
	PRM_GYR_RANGE	
	Масто	Description
	GYR_RANGE_250DPS	Gyr. Range = 250 deg./s
	GYR_RANGE_500DPS	Gyr. Range = 500 deg./s
	GYR_RANGE_2000DPS	Gyr. Range = 2000 deg./s
	Macro	Description
	ACC RANGE 2G	Acc. range = 2g
	ACC RANGE 4G	Acc. range = $4g$
	ACC RANGE 8G	Acc. range = $8g$
	ACC_RANGE_16G	Acc. range = 16g
	PRM_MAG_RANGE	
	PRM_MAG_RANGE	Description
		Description Mag. range = 130uT
	 Macro	-
	Macro MAG_RANGE_130UT	Mag. range = 130uT
	Macro MAG_RANGE_130UT MAG_RANGE_190UT	Mag. range = 130uT Mag. range = 190uT
	Macro MAG_RANGE_130UT MAG_RANGE_190UT MAG_RANGE_250UT	Mag. range = 130uT Mag. range = 190uT Mag. range = 250uT
	Macro MAG_RANGE_130UT MAG_RANGE_190UT MAG_RANGE_250UT MAG_RANGE_400UT	Mag. range = 130uTMag. range = 190uTMag. range = 250uTMag. range = 400uT
	Macro MAG_RANGE_130UT MAG_RANGE_190UT MAG_RANGE_250UT MAG_RANGE_400UT MAG_RANGE_470UT	Mag. range = 130uTMag. range = 190uTMag. range = 250uTMag. range = 400uTMag. range = 470uT
Returns	Macro MAG_RANGE_130UT MAG_RANGE_190UT MAG_RANGE_250UT MAG_RANGE_400UT MAG_RANGE_470UT MAG_RANGE_560UT	Mag. range = 130uTMag. range = 190uTMag. range = 250uTMag. range = 400uTMag. range = 470uTMag. range = 560uT

Method name	<pre>bool getConfigurationPrm(int parameterIndex, int</pre>
	*parameter)

Parameters	parameterIndex	The parameter to be adjusted.
	parameter	Pointer to the retrieved parameter value.
	See setConfigurationPrm r	nethod for an explanation of supported paramer
	indices and parameters.	
Returns	None	
Description	Retrieves a configuration p	parameter.

Method name	void resetOrientation(void)	
Parameters	None	
Returns	None	
Description	Resets the orientation offset of the sensor.	

Method name	void saveCalibrationData(void)
Parameters	None
Returns	None
Description	Starts saving the current parameter settings to the sensor flash memory.

Method name	<pre>virtual void getCalibratedSensorData(float g[3],</pre>		
	float a[3], float b[3])		
Parameters	g[02]	Calibrated gyroscope data (x, y, z-axis).	
	a[02]	Calibrated accelerometer data (x, y, z-axis).	
	b[02]	Calibrated magnetometer data (x, y, z-axis).	
Returns	None		
Description	Retrieves calibrated sensor data (gyroscope, accelerometer,		
	magnetometer).		

Method name	virtual void getQuaternion(float q[4])
Parameters	q[03] Orientation quaternion (qw, qx, qy, qz)
Returns	None
Description	Retrieves the 3d orientation quaternion.

Method name	<pre>virtual void getEulerAngle(float r[3])</pre>
Parameters	r[02] Euler angle vector (around x, y, z-axis)
Returns	None
Description	Retrieves the currently measured 3d Euler angles.

Method name	<pre>virtual void getRotationMatrix(float M[3][3])</pre>	
Parameters	M[02][02] Rotations matrix (row i=02, column j=02)	
Returns	None	
Description	Retrievs the current rotation matrix.	

Example Code

Connecting to the an LPMS-CU device

1	#include "LpmsSensorI.h"
2	#include "LpmsSensorManagerI.h"
3	
4	main()
5	{
6	// Get a LpmsSensorManager instance
7	<pre>LpmsSensorManagerI* manager = SensorManagerFactory();</pre>
8	
9	// Connect to LPMS-CU sensor with address A123456
10	<pre>LpmsSensorI* lpms = manager->addSensor(DEVICE_LPMS_U, "A123456");</pre>
11	
12	while(1) {
13	float q[4];
14	
15	// Read quaternion data
16	<pre>lpms->getQuaternion(q);</pre>
17	
18	// Do something with the data
19	//
20	}
21	
22	// After doing the work, remove the initialized sensor
23	<pre>sm->removeSensor(lpms);</pre>
24	
25	// Delete LpmsSensorManager object
26	delete manager;
27	}

Setting and Retrieval of Sensor Parameters	5
--	---

1	/* Setting a sensor parameter. */
2	<pre>lpmsDevice->setParameter(PRM_ACC_RANGE, LPMS_ACC_RANGE_8G);</pre>
3	
4	/* Retrieving a sensor parameter. */
5	int p;
6	<pre>lpmsDevice->setParameter(PRM_ACC_RANGE, &p);</pre>

Sensor and Connection Status Inquiry

1	/* Retrieves current sensor status */
2	<pre>int status = getSensorStatus();</pre>
3	
4	switch (status) {
5	case SENSOR_STATUS_RUNNING:
6	<pre>std::cout << "Sensor is running." <<std::endl;< pre=""></std::endl;<></pre>
7	break;
8	
9	case SENSOR_STATUS_PAUSED:
10	<pre>std::cout << "Sensor is paused." <<std::endl;< pre=""></std::endl;<></pre>
11	break;
12	}
13	
14	<pre>status = lpmsDevice->getConnectionStatus();</pre>
15	
16	switch (status) {
17	case SENSOR_CONNECTION_CONNECTING:
18	<pre>std::cout << "Sensor is currently connecting." <<std::endl;< pre=""></std::endl;<></pre>
19	break;
20	
21	case SENSOR_CONNECTION_CONNECTED:
22	<pre>std::cout << "Sensor is connected." <<std::endl;< pre=""></std::endl;<></pre>
23	break;
24	}

In case you have any further questions regarding the programming interface please contact LP-RESEARCH directly.
